Exposed−subgroup predictive margin estimates the observed marginal risk
Conditional risk ratio
Predictive margins
Schoenfeld Residual
Bayesian Information Criterion (BIC)
Full−sample predictive margin estimates the causal marginal risk
Which estimands are collapsible?
Causal marginal risk equals potential mean
Conditional risk difference
The profile likelihood at the MLE recovers the partial likelihood
Akaike Information Criterion (AIC)
Estimated Risk Score
Observed and causal marginal risks coincide without confounding
Profile maximum likelihood estimate of each point mass
The which−subject−fails factor
Deviation of an observation from its subpopulation mean
Risk Score
Observed marginal risk
Collapsibility
Inverse survival function
The whether−a−failure−occurs factor
Profile likelihood in terms of point masses
Cox proportional hazards model
Consistency of g−computation
def−cooks−distance−glm
Deviations in Gaussian models
Survival function
Cox PH partial likelihood
Point−mass optimality of the profile baseline hazard
Marginal risk as a conditional expectation
Standardized Pearson residual
Pearson residual
Single−subject failure probability in a risk set
G−computation
Causal marginal risk under identification assumptions
Derivative of expit
Likelihood regrouped by interval
Per−interval likelihood factor
Proportional−hazards first−order interval failure probability
Risk−set score total
Conditional predicted risk
Leverage for a GLM
Exact discretization of the survival factor
Causal marginal risk
Proportional−hazards decomposition of the hazard
Potential mean
Derivative of odds in terms of probability
Derivative of inverse odds function
Derivative of odds function in terms of odds
Censored−data likelihood
First−order interval failure probability
Derivative of odds w.r.t. log−odds
Derivative of log−odds by probability
Derivative of probability w.r.t. log−odds
Gradient of odds w.r.t. coefficients
Derivative of probability w.r.t. linear predictor as a variance
conditional log−hazard
Odds
Odds as a function of probability
Derivative of odds function
Derivative of log−odds by odds
Derivative of log−odds with respect to coefficients
Gradient of fitted probability w.r.t. coefficients
conditional hazard
Hazard
One−way random−effects model
log−odds
Derivative of log−odds by odds
cumulative hazard
Moments of the one−way random−effects model
Probability as a function of odds
Difference of log−hazards between two covariate patterns
Intraclass correlation in terms of variance components
Derivative of logit function
Expected mean squares in the one−way random−effects model
logit function
Method−of−moments estimators of the variance components
Difference in covariate patterns
Hazard ratio under proportional hazards
Intraclass correlation
Mean and variance of residuals
hazard ratio
Odds ratios are reversible
Odds function
inverse odds function
Simplified expression for inverse odds function
Number at Risk
Predicted value
expit
Risk Set
Hat matrix
Conditional odds
Odds ratio
Difference in log−odds
Conditional odds ratios are reversible
Odds via the odds function
Cox−Snell generalized residuals
Difference in log−odds
Relative risk ratios
Odds from log−odds
One minus inverse−odds
General formula for odds ratios in logistic regression
Conditional distribution of residuals in Gaussian models
Expanded expression for logit
Fitted value
Martingale Residual
Log−odds as a function of probability
Inverse−odds function inverts the odds function
Probability as a function of log−odds
Expressions for expit function
Shorthand general formula for odds ratios in logistic regression
Log−odds via the logit function
Odds ratio as risk ratio times a correction factor
Odds of a non−event
Odds ratio as a ratio of ratios
Deviance Residual
Probability via the expit function
logit and expit are each others' inverses
One minus expit
Probability of a non−event from the odds
Probability via the inverse−odds function

Type Definition Theorem Lemma Corollary Proposition
